| Delivery date | 22 August 2026                                        |
| Project       | European Consultant website and administration portal |

# 1. Project Overview

The European Consultant platform is a responsive website for visa, relocation, HR, and international business services. It combines a public marketing experience with a protected administration portal and online appointment payments.

## Delivered solution

| Area              | What is included                                                                                                   |
|-------------------|--------------------------------------------------------------------------------------------------------------------|
| Public website    | Home, About, Services, Testimonials, Contact, Appointment, booking success, and confirmation pages.                |
| Service catalogue | Database-driven service listings, grouped by service type, with individual SEO-friendly detail URLs.               |
| Administration    | Secure login, dashboard, service creation/editing/deletion, publishing controls, and appointment price management. |
| Payments          | Stripe Payment Intents for appointment fees, with validated customer, date, time, WhatsApp, and message details.   |
| Enquiries         | Contact form submission through FormSubmit with a honeypot field for basic spam reduction.                         |

## Technology foundation

- **Application:** Next.js 14 App Router, React 18, and TypeScript.
- **Design:** Tailwind CSS with the Swedish blue and yellow visual identity.
- **Data and access:** Supabase database and Supabase Auth.
- **Payments:** Stripe server-side payment creation and Stripe-hosted payment components.
- **Hosting readiness:** Standard Node.js deployment workflow; suitable for Vercel or another Next.js-compatible host.

**Delivery principle:** source code, documentation, and client-owned platform credentials should remain separate. The source archive intentionally excludes local secrets, build output, dependencies, Git history, and hosting metadata.

# 2. Our Delivery Process

## 1 Discovery and scope

We translate the business goals into clear pages, user journeys, service categories, appointment requirements, and administrative responsibilities.

## 2 Information architecture and design

Content is organized into real routes so visitors can navigate naturally, share direct links, and benefit from page-specific metadata. Shared navigation, footer, typography, spacing, color, and responsive behavior create a consistent experience.

## 3 Application development

The interface is implemented as reusable React components. Public content queries are separated from protected admin actions. Validation is applied to editable content and booking inputs before data or payment operations proceed.

## 4 Platform integration

Supabase provides authentication and content storage. Stripe provides payment processing. FormSubmit receives general enquiries. Each platform must be configured under accounts controlled by the client.

## 5 Quality review

The delivery workflow includes dependency installation, production build validation, route and form checks, responsive review, and verification of environment configuration in a non-production environment before launch.

## 6 Launch and handover

Production environment values are configured securely in the hosting dashboard. After deployment, the live domain, authentication, service publishing, enquiry delivery, and a Stripe test transaction are checked end to end.

**Important:** never send Stripe secret keys, Supabase private credentials, passwords, or production environment files through ordinary email or include them in a source archive.

# 3. Setup and Launch Checklist

---

## Local setup

1. Install a current supported Node.js LTS release.
2. Extract `delivery.zip` and open the project directory.
3. Run `npm install`.

4. Create a local `.env` file and add the required values listed below.
5. Run `npm run dev` and open `http://localhost:3000`.
6. Before deployment, run `npm run build`.

## Required environment values

| Variable                              | Purpose                                                                                   |
|---------------------------------------|-------------------------------------------------------------------------------------------|
| <code>SUPABASE_URL</code>             | Supabase project URL used by the server.                                                  |
| <code>SUPABASE_PUBLISHABLE_KEY</code> | Supabase publishable/anon key. <code>SUPABASE_ANON_KEY</code> is supported as a fallback. |
| <code>STRIPE_SECRET_KEY</code>        | Server-only Stripe secret key used to create Payment Intents.                             |
| <code>STRIPE_PUBLISHABLE_KEY</code>   | Publishable Stripe key used by the booking page.                                          |

## Production launch

- Create or confirm the Supabase tables, access policies, and an approved admin user.
- Add the environment values in the hosting provider; do not upload the local `.env` file.
- Use Stripe test mode first. Confirm payment creation, completion, receipt delivery, currency, and amount.
- Submit the contact form once and complete FormSubmit activation for the configured receiving inbox.
- Connect the production domain, enable HTTPS, and verify all navigation and service detail links.
- Confirm that unauthorized users cannot access or modify protected admin content.

## 4. Handover and Acceptance

---

### What the client receives

- **delivery.zip** — application source code and both handover PDFs, without secrets or generated dependencies.
- **Project Process & Handover.pdf** — this implementation and launch guide.
- **Website Management Tips.pdf** — practical operational, security, content, and growth recommendations.

### Ownership transfer checklist

| Item               | Acceptance check                                                                                |
|--------------------|-------------------------------------------------------------------------------------------------|
| Hosting and domain | Client has owner/admin access, billing visibility, and renewal control.                         |
| Supabase           | Client owns the project, can manage users, and understands backup options.                      |
| Stripe             | Client owns the account, bank details, tax settings, team access, and recovery methods.         |
| Email              | Receiving address is correct, FormSubmit is activated, and test enquiries arrive.               |
| Admin portal       | Client can sign in, update pricing, create/edit services, preview, publish, and remove content. |
| Recovery           | Multi-factor authentication and recovery codes are stored securely for all critical accounts.   |

## Recommended acceptance test

1. Review every public page on desktop and mobile.
2. Create a draft service, publish it, open its public page, then edit it.
3. Update the appointment price and confirm it appears on booking and service pages.
4. Complete a Stripe test payment and verify the expected Stripe records and receipt.
5. Submit a contact enquiry and confirm delivery to the intended inbox.
6. Verify the production build completes without errors.
